1. Introduction

The statistical operation of the Survey on the Reconciliation of Work, Family and Personal Life (CVL) is to provide political, economic and social agents, universities, private researchers and the general public with detailed and up-to-date information regarding the possibilities that people resident in the Basque Country have of combining their working lives with their family and personal lives.

The files for the 2013 Survey on the Reconciliation of Work, Family and Personal Life (CVL2013) constitute a product for circulation directed at users with experience in the analysis and treatment of microdata. This format provides an added value to users, permitting them to carry out data exploitation and analyses that, owing to obvious limitations, cannot be covered by current circulation in the form of tables, publications and reports.

This report describes the microdata file on individuals, together with their family characteristics. We have opted to use a families-individuals file for circulation on the basis of the usefulness and quality of the information that is to be included as well as the interest for users, because it is more beneficial for the person receiving the data to be able to work with them in a combined form.

2. Criteria for selection of variables

This file contains a selection of variables collected in the survey for the selected individuals and their family characteristics. The selection of variables was based on criteria for both confidentiality and quality, which are detailed below:

2.1 Criteria of confidentiality

This content refers to data that are especially protected by the Personal Data Protection Act and that require express consent from the surveyed individual for them to be handed over. In this survey the variable "nationality" was considered as sensitive and it was decided not to disseminate it.

2.2 Confidentiality criteria

Maintaining the statistical secrecy of the informants is one of the main premises that govern this statistical activity. Therefore, the dissemination of any individual information collected under statistical secrecy must be carried out anonymously and in such a way that it cannot be associated with any specific individual, not even via the content or disaggregation of the disseminated variables.

Therefore, in order to guarantee this safeguard, the following restrictions have been applied to the CVL 2013 file:

- Under no circumstances are direct identification variables or data of a personal nature (national identity document, name, surname, addresses, telephone numbers, etc.) to be included.
- The maximum geographic disaggregation included is the province.

- The age of the person of reference is presented in multiples of ten years.
- A grouping of the family size variable that does not allow the identification of "singular" units is used.
- A grouping of the variable "level of education" is used.
- A grouping of the variable "main occupation" is used.
- Numerical variables are not included, except individual weighting.

2.3 Quality criteria

The main limitation in any survey by sample is due to the availability of information solely for the sample units and not for the total objective population. The sampling design of the survey will shed light on the level of representativeness that can be achieved with the information collected.

In the case of the CVL, the sample base used was the households selected for the Survey on the Population in Relation to Activity (PRA) that was conducted in the same quarter of reference. For the main variables and crosses of the survey the level of representation required is Provincial. However, the large number of variables and the high level of detail that can be achieved with the variables included in this file do not guarantee the statistical significance of all the operations or analyses that can be performed on this data.

The conclusions derived from studies or analyses performed on this data are the responsibility of the end user. However, to give an idea of the quality of the information for a specific cross or disaggregation, we recommend going to the sampling error tables for the survey (http://www.eustat.es/document/datos/Errores_CVL_web_c.asp#axzz2C6glShcx) and the relevant Report on the Calculation of Sampling Errors (http://www.eustat.es/document/datos/Calculo_errores_CVL_c.pdf) that gives recommendations on the acceptable levels of sampling errors.

3. Registry design

The families-individuals microdata file of the CVL 2013 has a text format with fixed columns, and it is structured around the thematic areas collected by the survey for this statistical unit.

4. Description of variables

Includes the literals corresponding to the coding of each of the variables included in the file. See Appendix.
